

## CLIMATOLOGICAL DATA

## COLORADO SECTION

J. M. SHERIER

PRICE: 5 CENTS A COPY; 50 CENTS A YEAR

5

VOL. XXXX DENVER, COLO., MAY, 1935

No. 5

## GENERAL SUMMARY

A deficiency in temperature was state-wide, only one station, Fruita, reporting a slight excess. The month was the third coldest May of record, averaging  $3.4^{\circ}$  below normal, and brought to an end the most prolonged period of warmth since the beginning of observations. Average daily deficiencies were greatest in the South Platte River Valley; however, deficiencies of from  $4^{\circ}$  to more than  $8^{\circ}$  were common generally east of the mountains. The month opened cold, with temperatures well below normal during the first five days. Warmer weather prevailed generally from the 6th to the 12th, after which the temperature again fell and averaged as much as  $19^{\circ}$  below normal during the following 10 days. From the 23d to the 27th, a change to warmer occurred west of the mountains, the month closing with cooler weather over northern and western counties. A decided deficiency in sunshine prevailed throughout the State.

This was the wettest May in the 48 years of climatic history. The monthly mean, 3.74 inches, was the greatest mean in any month since April, 1905, when the average for the State was 3.94 inches. The excess was state-wide, only 10 stations, scattered over the lower portions of the Colorado and Gunnison River valleys and extreme southeast and east-central counties, reporting deficiencies. Amounts were greatest in the drainage basin of the South Platte River and in El Paso County, where excesses of from 3.00 inches to more than 6.00 inches occurred. A general account of floods resulting from heavy local downpours through this region is published on page 25 of this publication, together with a general summarization of dust storms. The average number of days with 0.01 inch or more of precipitation, 15, has never been equalled during any month since the beginning of the State Climatological Service in 1888.

The cold, rainy weather on the western slope was detrimental to shearing and lambing, and tender ground crops were injured by frost in the colder portions of the Colorado Valley on the 5th. Western livestock was in fair condition, and the movement to higher ranges was started. The growth of vegetation was slow generally everywhere in the State because of the low temperatures. Sufficient precipitation occurred in southeastern counties to effectively break the drought, but more moisture still is needed in that region.

## TEMPERATURE

The monthly mean for the State, as shown by the records of 89 stations, was  $48.7^{\circ}$ , which is  $3.4^{\circ}$  below the mean for the past 48 years. The highest monthly mean was  $60.6^{\circ}$  at Palisade and the lowest,  $35.0^{\circ}$ , at Lake Moraine. The highest,  $94^{\circ}$ , occurred at Cheyenne Wells on the 31st, and the lowest  $8^{\circ}$ , at Hermit (near) and at Lake Moraine on the 4th. The greatest daily range was  $56^{\circ}$ , at Bloom on the 30th.

## PRECIPITATION

The average for the State, as shown by the records of 112 stations, was 3.74 inches, which is 1.83 inches above the mean for the past 48 years. The greatest monthly amount was 9.47 inches at Hawthorne, and the least, 0.41 inch at Cortez. The greatest precipitation in any 24 consecutive hours was 3.00 inches at Rush on the 30th.

## PRESSURE, WIND, HUMIDITY, AND SUNSHINE

**SEVERE DUST STORMS IN COLORADO DURING MAY, 1935**

Light to moderate dust occurred generally over eastern counties on the 1st. On the 8th, a dust pall began moving in from the southeast across Baca and Prowers counties, and on the 10th and 11th the coppery-hued silt was observed at high altitudes as far in the interior of the State as north-central elevated sections. During the early afternoon of the 30th, southwesterly winds bore dust across the Utah-Colorado border into the

Dolores and lower Gunnison River valleys. The only storms of consequence were in extreme eastern counties on the 31st, when heavy dust occurred along the Colorado-Kansas border, reducing the visibility to from 100 to 900 feet in Baca and Prowers counties. On the whole, these storms were of much less intensity than those of March and April and were not attended by serious damage or discomfort.

**FLOODS IN COLORADO DURING MAY, 1935**

During the closing days of the month, excessively heavy rains occurred over the northern two-thirds of the eastern slope of Colorado. On the 26th, a large volume of water surged down Pawnee Creek, drowning 3 persons. On the 27th, a part of the dam at Terry Lake near Longmont went out, flooding the low-lying farm lands and a section of the city of Longmont.

On the 30th, excessive local downpours occurred in the vicinity of Colorado Springs and along the northern slope of the Arkansas-Platte Divide. Flood waters along the Fountain River in the vicinity of Pueblo caused an estimated damage to property of \$165,150. Four lives were lost and a total estimated property damage of \$1,800,000 occurred along Monument Creek and Fountain Creek in Colorado Springs and vicinity, when those streams rose suddenly as a result of the excessive precipitation.

During and after the occurrence of the excessive local rains along the northern slope of the Arkansas-Platte Divide, Kiowa, Bijou, Badger, Beaver, and Comanche creeks quickly overflowed their banks and sent enormous volumes of water toward the South Platte River at Fort Morgan and Brush. At the height of the flood, skies over extreme eastern counties were a chocolate-

brown. This was due to a most unusual situation. Along the Colorado-Kansas border there was a heavy dust storm. Clouds of dust could be seen for miles, while to the west torrents of flood waters roared and at Bovina, hailstones, some as large as baseballs, were reported to have fallen. The coppery-hued sky cast a brown shadow, giving the scene a weird appearance. At the same time, Cherry Creek, where it flows through Denver, reached a bankful stage, and ordinary streamlets and arroyos in this section of the State soon became raging torrents. A phenomenal 2-hour rainfall of 9.00 inches was reported to have occurred at Seibert during the late afternoon of the 30th by the Cooperative Observer at Stratton. As the month closed, the combined floods in the small streams north of the Arkansas-Platte Divide were leaving the northeast corner of the State at Sterling and Julesburg.

The total loss of life in the State as a result of the floods was 19, while two other persons were unaccounted for. The counties where deaths occurred and the number of deaths were as follows: Adams, 2; Elbert, 6; El Paso, 4; Morgan, 4; and Logan, 3. The total property damage was estimated at from 8 to 10 million dollars.—H. F. C.
